

Who should not (yet) be vaccinated?

To achieve group immunity, everyone (over the age of 12) should be vaccinated. You can contribute as well.

As a precaution, **specific groups are currently excluded from vaccination:**

- ✓ Children under 12 years of age
- ✓ People with a fever and symptoms that may indicate an acute infection
- ✓ People who have recently tested positive for corona and have not yet been symptom-free for 14 days
- ✓ People with a history of severe allergic reactions

Based on new data, it is now recommended for pregnant women and women with childbearing potential to be vaccinated.

Still in doubt?
Talk to a doctor (your GP or an occupational physician).
